Secure Sports Dubs (SSD)

_____With the growing popularity and new legality of mobile sports betting in New York, I think it would be interesting to explore building a secure mobile application for sports betting. To make a sports betting app secure, we will need to encrypt bank information, account information, specific bet information, and possibly explore implementing some type of 2FA. For possible legal and scope reasons, taking real payment deposits and placing real bets that payout will probably not be implemented for the final project, but we can use dummy data to simulate the real bets, deposits, and payouts.
